SUMMARY

I make engineering work run through coding agents, and I did it on my own production systems first. Since July 2026 about nine in ten of my commits are written with Claude Code, in repositories I set up so an agent cannot read secrets, skip checks or guess at conventions. Before that I spent nearly two and a half years building software that had to work on the day, in front of clients and live audiences. Strong TypeScript, and comfortable in shells, processes and git.

MAKING REPOSITORIES AGENT-READY

- **Agent instructions in 8 production repositories.** The entry file is an index that points each session at only the docs its task needs, backed by a dated project log and a decision log. When the entry file sent every session to one 861 KB log, about 210,000 tokens, sessions started out drowning; the log is now archived by month and searched instead of read.
- **Rules as checks, not sentences.** Tenant isolation, money handling and migration safety each exist as a script that fails the build, because an instruction followed most of the time still ships the mistake eventually.
- **Least privilege for the agent.** Cut its permission list from 662 rules to 62 with explicit deny rules. Production is reachable only through one committed command-line tool that loads credentials itself, and a pre-tool hook blocks reading secret files. Requests outside the policy reach my phone, and fall back to the editor prompt if unanswered.
- **An incident:** a hook used a repo-relative path, so a subagent running from a subdirectory could not find it. A failing pre-tool hook blocks every tool call rather than failing open, so the session stalled. I recovered through throwaway git worktrees and fixed every hook to resolve from the project root.
- **Adoption that sticks:** an agent works merchants' support tickets end to end, from reproducing at their screen size to deploying and closing with a plain note. In its first six weeks one in three fixes came back reopened, almost all reasoned from code and never observed, so observed evidence became a condition of closing.

EXPERIENCE

SEA Media | Senior Full-Stack Engineer and Project Partner

India (Remote) | 05/2025 - Present

- **Enrixa Store:** a multi-tenant e-commerce platform (NextJS, Prisma, PostgreSQL, two Next.js apps; 60 data models, 287 endpoints) built mostly with Claude Code, 1,276 of my 1,357 commits. Every push runs a tenant-isolation check and a migration check, so a query that could show one merchant's data to another fails the build, whoever wrote it.
- **Close to the operating system:** wrote the production operations tool in Python: SFTP transfers, pinned host keys, sealed secrets, detached runs into named logs, and a deploy step that diffs every other process on the host by PID to prove it was untouched.
- **W.I.N.S, Alabama Department of Public Health:** led a Next.js admin on Supabase and a Flutter app sharing one Postgres database, and wrote the schema contract and ownership rules that let two teams change it without breaking each other. Live on both app stores since July 2026.
- **Enrixa AI:** a shopping assistant live for a real online pharmacy, falling back across Claude and Gemini, with 132 behaviour tests that run the real assistant.
- Also a Shopify Hydrogen storefront serving more than 10,000 daily users, and a Shopify repricing app that stays in dry-run until the merchant approves.

NTAM Group (Delta Plus Event Management) | Software Developer

Dubai, UAE | 06/2024 - 04/2025

- Built for live launches, where there is no second attempt: a body-tracking growth wall for Nestlé's Ascenda launch at the Ritz-Carlton, Jeddah, used by more than 150 guests in one evening, and L'Oréal's event app at more than 5 live events.
- Built a training platform for Abbott used by more than 1,000 medical representatives, and a talking avatar assistant answering Novartis product questions.

Indus Real Estate LLC | Full-Stack Developer

Dubai, UAE | 12/2022 - 06/2024

- Built a lease management system for more than 200 units, and cut the public property site's load time by 70 percent.

DOSII | Flutter Developer India | 06/2022 - 12/2022

OPEN SOURCE

bouncer-gates - checks that stop expensive mistakes before they merge, as a CLI, GitHub Action, MCP server and editor hook. Clear exit codes (0 clean, 1 blocked, 2 the tool itself could not run), a skip with a reason instead of a silent pass when a shallow clone hides history, and a Windows-only crash on exit traced to a pooled network socket. Listed in the official MCP Registry.

github.com/ajeermahmood/bouncer-gates

agent-ready-repo - a template for a repository coding agents can work in safely. github.com/ajeermahmood/agent-ready-repo

estate - one Go binary that checks a whole folder of repositories against declarative rules and fails CI. github.com/ajeermahmood/estate

WRITING

How I build software with AI agents ajeer.website/how-i-work · **What my coding agents got wrong, and what caught it** ajeer.website/blog

SKILLS

Languages: TypeScript, JavaScript, Python, Go, SQL, Bash, PowerShell

Coding agents: Claude Code (instructions, skills, hooks, permission policy, subagents), MCP servers

Git and delivery: branches, merges, worktrees, GitHub Actions, pull-request checks, Docker, Linux with PM2 and Nginx, Cloudflare Workers, Vercel

Application: Node.js, NestJS, Next.js, React, PostgreSQL, Prisma, Supabase, Redis

EDUCATION

Crossroads Software Engineering Bootcamp | India | 08/2020 - 11/2021
